

GEMMACON

Ramp-Up Management

Ramp-Up Management

The coordination of all ramp-up activities with focus on logistic requirements in series production. In our team of experts, we have deepened knowledge from the ramp-up strategy to change-management up to procurement logistics.

Logistics planning

Planning, optimization and documentation of international supply chains of new-type and production vehicle components are the foundation of our inbound logistics planning. Saving potential through cost calculation and optimization of logistics costs.

Disposal

On-demand and on-schedule determination and procurement of components to ensure production supply.

Focus: agile inventory management to avoid high capital commitment costs and early congestion management for the smooth supply of assembly.

Change management

Organizational change management processes and execution, documentation of change requests during a project.

Congestion management

Congestion caused optimal deviations from standard processes through effective and efficient management of logistics systems, structures and processes.

GEMMACON

Customers reference

We supply the assembly with the required components and avoid bottlenecks at an early stage through a good congestion management.

Situation

- International scope of procurement of components for serial production of engine plants

Our solution

- Ensuring customer-specific parts provision
- Ensuring on-time delivery and coordination of congestion through congestion management
- Creation and maintenance of scheduling agreements and delivery schedules
- Coordination of the supply chain
- Coordination with the involved departments operational control, change management, quality, purchasing

Results

- Smooth sequence of serial production
- Early detection of congestion
- Optimization of logistics processes
